← Single Blog Page

The Positives

We were able to meet up multiple times which helped us resolve issues quickly.

Our 3rd Party API works well and is updated frequently

In the beginning we were able to set an effective plan and time management.

Our React Router is completely functional and accesses multiple pages

Frontend and Backend communicate effectively and is well styled.

The Struggles

Initially had issues with the Git Branching. (Luckily this was early on)

Working remotely proved to be a slight road block but we were able to meet several times.

React Router gave us some issues but it was resolved rather quickly.

Our C.R.U.D functionality is present on both front and back ends with a slight bug.

One of our components is way to smart for it's own good. We tried to refactor and break down this component.

Our Code Snippet

```
render() {
  return (
      <div className="App">
        <Header />
        <Nav />
        <div className="ticker">
        <Ticker
          tickerList={this.state.tickerList}
        />
        </div>
        <main>
          <Switch>
            <Route
              exact
              path="/"
              render={props => <Home {...props}
                blogs={this.state.blogData}

              />}
            />
            <Route
              path="/blogs/:id"
              render={props => <Blog {...props}
                blogs={this.state.blogData}
                deleteBlog={this.deleteBlog}
                editBlog={this.editBlog}
              />}
            />
            <Route path="/about" component={About} />
            <Route path="/resources" component={Resources} />
            <Route
              path="/create"
              render={props => <BlogForm {...props}
                blogSubmit={this.blogSubmit}
              />}
            />
```
